

Livable Community

Key Result: Increase cycling network by 3km

Expanding the cycling facilities for the community helps to keep our community liveable. Cycling provides many benefits for residents in terms of improved mobility, healthy and active lifestyles and recreation. This result focused on increasing the amount of dedicated cycling infrastructure available for residents.

What changed

Each year the Transportation team is focused on delivering solutions for the mobility needs of residents. This key result focused on increasing the total amount of cycling amenities in the city by 3km. The projects related to this infrastructure ensured that more streets now have clearly marked cycling paths and lanes that enable people to cycle for work or pleasure. Other projects continue to be funded through the City's Capital Budget to expand the amount of cycling paths and dedicated cycling lanes available for residents' use.

Why it matters

Community members have greater access to more cycling amenities and infrastructure through this key result. People can choose active transportation methods to get around the city, participate in recreation activities on their bikes, and children and youth can bike to school safely. Ensuring that cycling infrastructure meets the needs of all road users is important to reduce residents' reliance on cars (that contribute to greenhouse gas emission) while at the same time promoting healthy lifestyles that improve wellbeing.
